

2.4 Maintenance

Ease of maintenance separates Fellert Acoustical Plaster from the competition. The plaster is anti-static — dust particles are not attracted to the surface, thus reducing the need for extensive cleaning.

The material can be vacuumed during the general maintenance of the building to prevent buildup of dirt deposits.

Additionally, the entire wall or ceiling can be recoated with a new surface or color with little impact on the structure's acoustical performance.

Work Flow and Repairability

The unique cotton fiber composition of the Fellert Acoustical Plaster allows the applicator more time to work with the product. Unlike traditional plaster coatings, Fellert Acoustical Plaster allows for easier repairs of the surface.
